

Medication Management

In New Zealand and Australia an estimated twice as many people are admitted to hospital as a result of not taking their medications correctly to those admitted as a result of road accidents. This is a huge and largely preventable problem. Medication management systems are an essential tool for the health delivery sector as it increases the health and well-being of patients as well as enabling increased service delivery within constrained budgets.

OUR SOLUTION

Monitoring Services

We monitor a range of devices to provide piece of mind to the person being monitored and their care giver(s) as well as secure access to key information to nominated person(s) via the Internet.

SimpleMed

The SimpleMed medication organiser is designed to be used in the home and connected to a monitoring centre service. The device allows a person or their caregiver to organise medication one week in advance. It includes medication reminders. Failure to take medication at a prescribed time generates an event within the system that sets in train a series of follow-ups by the monitoring centre service. A secure Internet based system allows authorised people access to the adherence routine.

Optional:

- Personal safety alarm

Community Applications

Inexpensive device for those people in the community with chronic conditions where there is medication time sensitivity. Also a useful alternative to a personal alarm device when fitted with the option personal safety alarm.

Facility Applications

SimpleMed could be used in facilities. However, we recommend the TabSafe device as it is a secure and robust system that reduces the risk of misuse. Secondly it can be loaded with 28 days medication thereby reducing overall operational service costs.

TabSafe

TabSafe is a comprehensive solution for medication compliance. It safely and effectively performs a wide range of functions including storing and releasing medications on a set schedule and managing as needed medication (eg pain killers). Alerts are sent to the monitoring centre service for a range of events, including when medication is not taken. A secure Internet based system allows authorised people access to the adherence routine.

Community Applications

With the capacity to dispense up to 28 days medication, TabSafe soon pays for itself in the community care sector where significant savings in labour can be achieved through reduced visits.

Facility Applications

TabSafe is optimal for healthcare and aged-care facilities where they can be provided as a value-added service differentiator. The ability to load 28 days medication in advance offers significant labour savings through a less frequent replenishment cycle.
